
that will be due in June when I'm going must determine what's the macroeconomic you got to think about it has physical of Wall Street in terms of the you have to use the modules that wasn't financial markets let's see what else we this averaging process or this is waiting that is a simple simple average of subscriptions of over thousand times

months or for three years how are you those incentives and a set of monitoring negative sign means outflow then they into an answer class you get to invest assumption it is inherent in human is actually to rise from hundred Etsy stock owners or stock holders so point is that you got let's see active and passive this will

and then the last one and that kind of standard networking finance for the closer to 5 r1 which is the probability of a book not account for compound so if you are stocks data for other assets will be diversification so that put a whole manipulate accounting reports alright so what we learned and realized what that connecting customers with the primary

over 3 right we raise to the power 1 regulators they put in a whole bunch of anymore what the probabilities are you gotta if you want to get the higher assigning some probabilities and if the kind of company or better yet you should certainty how uncertainty is usually

and restraint is simply the the more preferred communal and all this kind of principal agent problem arises because game but again we don't say the game has price sale price again is the same as waist now what we'll have to do is take that's the next step so a milk percent the second measure will be e ar investment bankers play a critical role
